

The Human Impact on Natural Resources - Life Expectancy and Infant Mortality (93 - 97)

Human Population & Growth Rate

- H.S.Sapiens population is exponential
- **%Growth rate**=
 - $((\text{Births} + \text{immigration}) - (\text{deaths} + \text{emigration})) / \text{total population} * 100$
- **Crude Birth/death rate**: # irl births/deaths per
person Homo Sapien Sapiens per year
- $(\text{CBR} - \text{CDR}) / 10 = \%GR$ (excluding migrator

Lower- and Higher-Income Countries

- 1.3B live in High-income
- 6.7B live in low-income
 - haven't yet industrialized/currently industrializing
- lower-income countries, particularly sub-Saharan Africa grow fast
 - 1.5% per year
- GRs in higher-income countries leveled off
 - 0.2% per year

Population size and Resource Use

- We H.S.Sapiens use a LOT of resources
 - WATER, FOOD, LAND, ELECTRICITY, and NATURAL MATERIALS
- Taxing on Earth
- **Environmental Impact** = Population*Resource Use Per Person H.S.S.*Impact of Resource

Factors Affecting Growth(Fertility)

- H.S.S. population is a system
 - Births are input, deaths are output
- **fertility rate**: mean of ~~children~~ offspring a ~~woman~~ mother H.S.S has
- **replacement fertility rate**: number of ~~children~~ offspring on average to replace the current population
 - Mostly 2.1
 - Can be made up for in immigration

Thank

k

You!
