

The “Great Acceleration” and the Beginning of the Anthropocene- The History of Oil Extraction(40-43)

The “Great Acceleration” and the Beginning of the Anthropocene

- **Great Acceleration(~1950 - today):** more people did more things that change climate(J. R. McNeill)
 - More people, more things being done[1780:>1B, 1930:~2B, 2024:8B]
 - Obvious, unprecedented, & powerful changes to earth
 - Stronger & faster than natural climate change

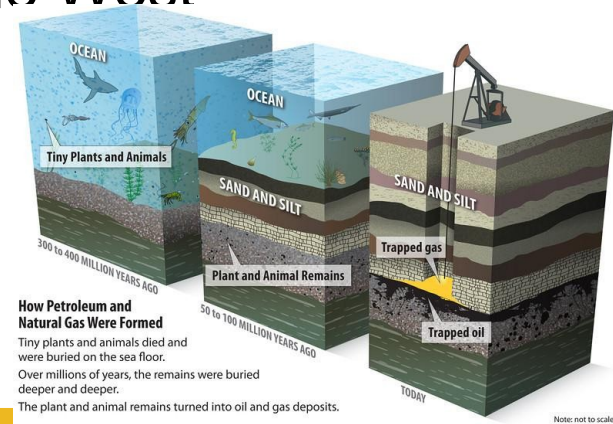

THE CAUSES OF THE ANTHROPOCENE

- More greenhouse gases -> more warming 🤯
- Lowest level increases temp. Highest levels decrease temp.[unstable 🤯]
- Eunice Newton Foote(1819–1888): water vapor & carbon dioxide could interact w/ sunlight to raise Earth's temp.
- We kinda run on fossil fuels
 - didn't see it coming

Global Production of Greenhouse Gasses

- **Fossil Fuels:** Ancient compressed life
 - Burning -> steam -> energy
 - Carbon & misc. Chemicals are released[become greenhouse gasses]
- 19th & 20th cent.: fossil fuel use was in the West
 - Became dependent
 - Countries on fossil fuels extract them
 - More countries depend on fossil fuels

I thank
you!
